COVID-19 Impact Index

# SAVI COVID-19 Impact Index

An index is used to summarize a complicated set of variables into one “average” quantity.

This index considers people affected by Covid-19, its socioeconomic impacts, well as existing socioeconomic and health vulnerability in neighborhoods.

Vulnerability

Impact

# Vulnerability Measures

## Socioeconomic Vulnerability

(Adjusted Social Vulnerabilities Index from CDC)

- Youth
- Older adults
- Poverty
- Non-English Speakers
- People of color
- Crowding
- Households without vehicles
- Income
- Adults without high school diploma
- Population in group quarters
- People with disability
- Single-parent households
- Unemployment rate

## Health Vulnerability

- Heart disease
- Diabetes
- COPD
- Kidney Disease
- Obesity
- Cancer
- Population lacking health insurance

# COVID-19 Impact Index

Vulnerability  
(weighted as 1/3 of  
score)

Impact (weighted as 2/3 of score)

Socioeconomic  
Vulnerability

Health Vulnerability

Health Impact  
(COVID-19 positive  
cases per 1,000  
population)

Economic Impact

- Unemployment claims (March-Aug)
- Rental assistance applications
- 2-1-1 calls

# COVID-19 Impact Index Scores

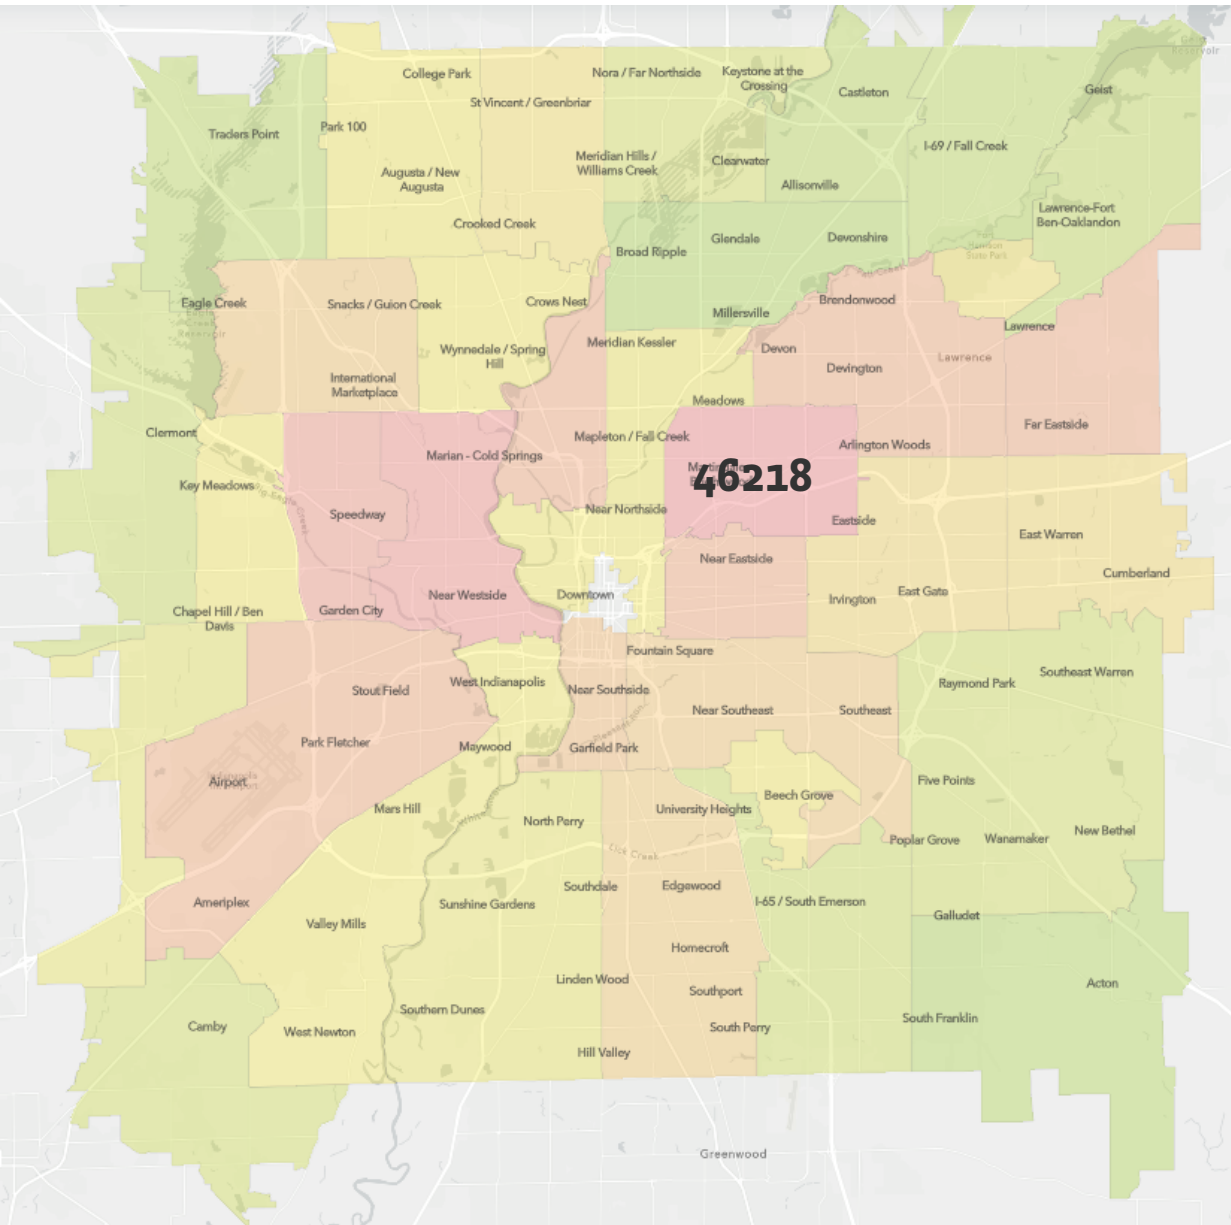

# COVID-19 Impact Index

Interactive Map

# Socioeconomic Vulnerability

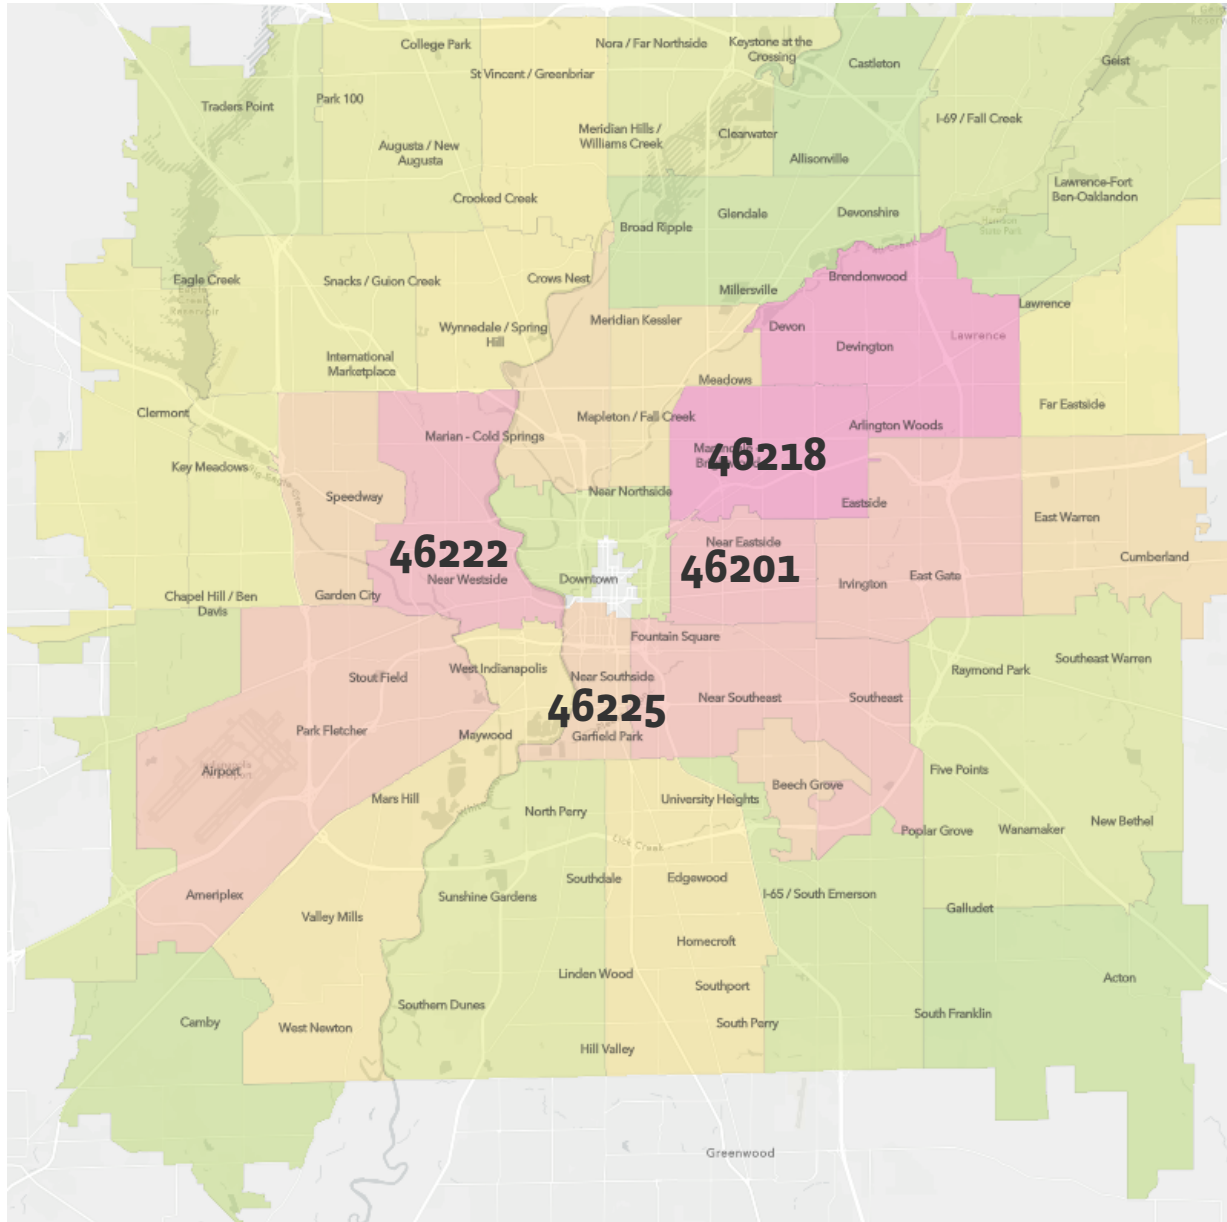

ZIP code **46218** had the highest level of socioeconomic vulnerability:

- One third of residents are in poverty
- Almost one fourth have a disability,
- Average unemployment rate between 2014 and 2018 was 15.4 percent.

# Health Vulnerability

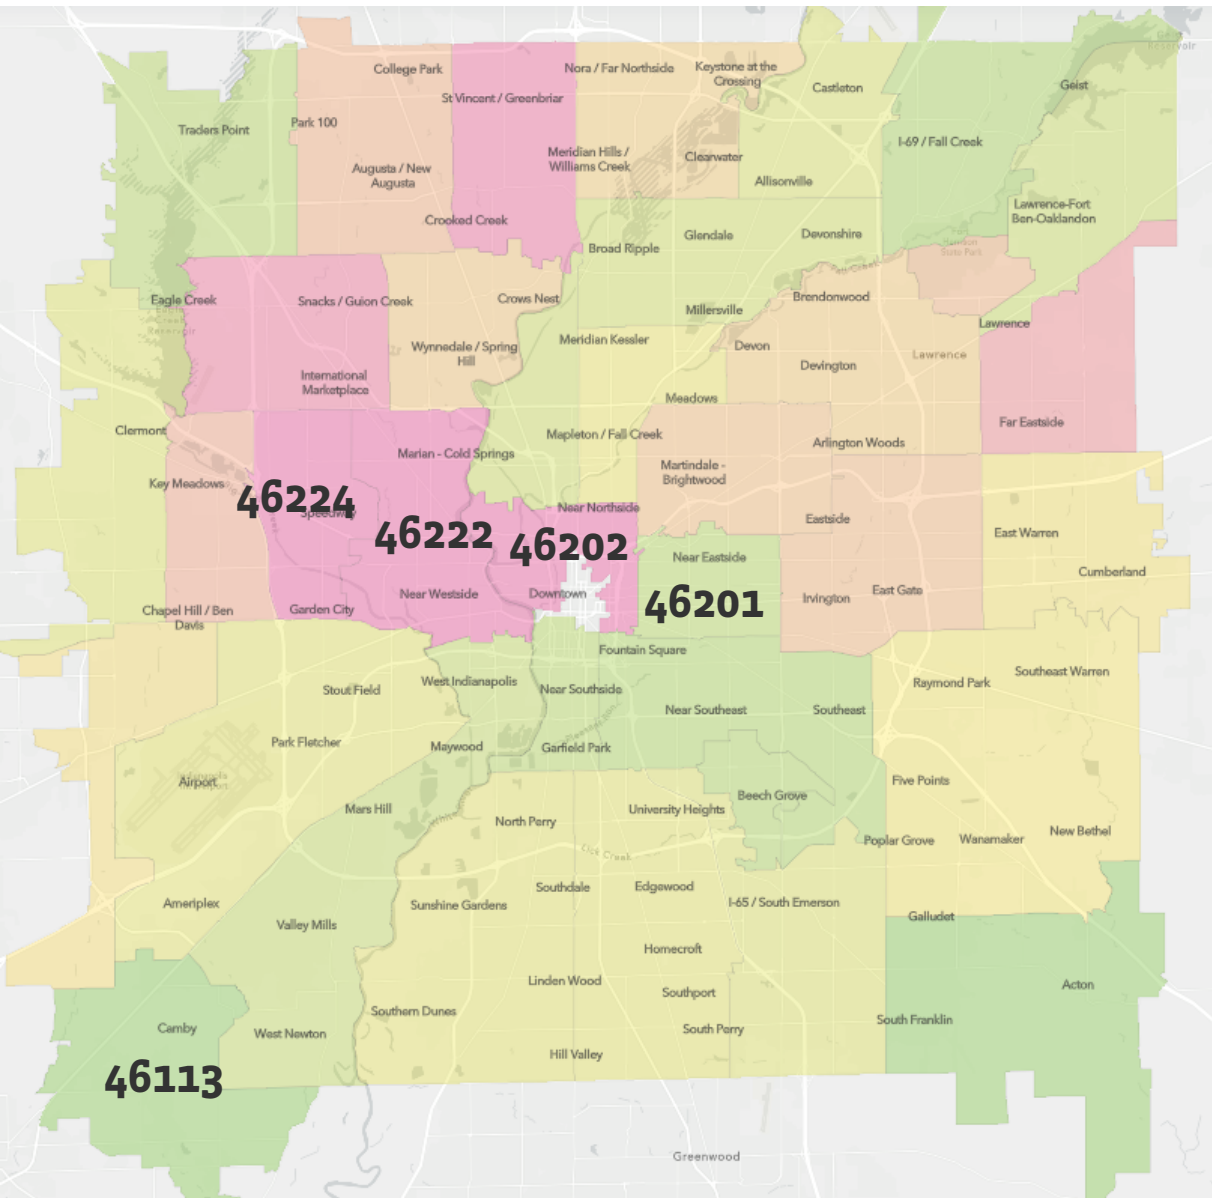

Health vulnerability is highest in the Near Westside, Near Eastside, and North eastside

- ZIP Code **46218** had an overall higher rates across most health vulnerability factors.
- ZIP Codes **46222** and **46201**, on the Near Westside & Near Eastside had the highest diabetes rates.
- ZIP Code **46255** had one of the highest rates of people without health insurance

# Health Impact (Confirmed Cases)

Number of confirmed cases is higher near downtown and on the near Westside of town:

- **46202:** 26.9 cases for every 1,000 people
- **46224:** 26.0
- **46222:** 23.8

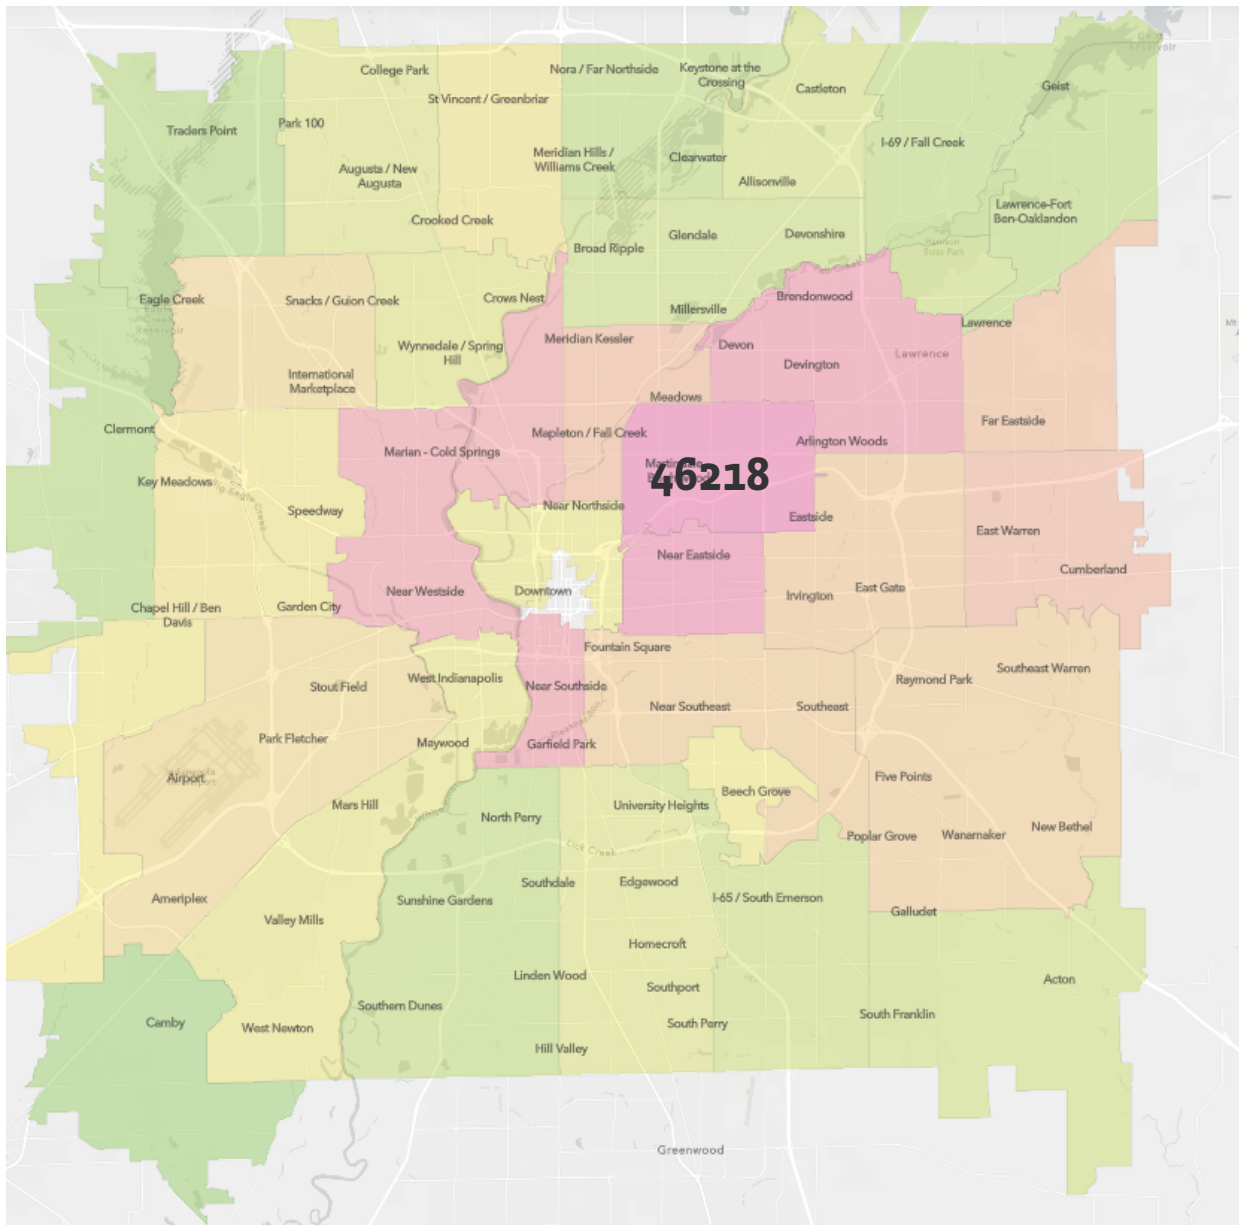

Some areas with low confirmed case rates:

- **46201:** 14.2
- **46113:** 9.7

# Economic Impact

**46218** has the highest economic impact score of any ZIP Code (252):

- Over 120 weekly unemployment claims per 1,000 people in labor force
- Increase of 30 additional 2-1-1 calls per 1,000 residents between Q1 and Q2
- Over 10 percent of renter households applied for rental assistance

COVID-19 Impact Score

# **Impact of COVID-19 accentuates pre-existing inequities**

COVID-19 Impact Score

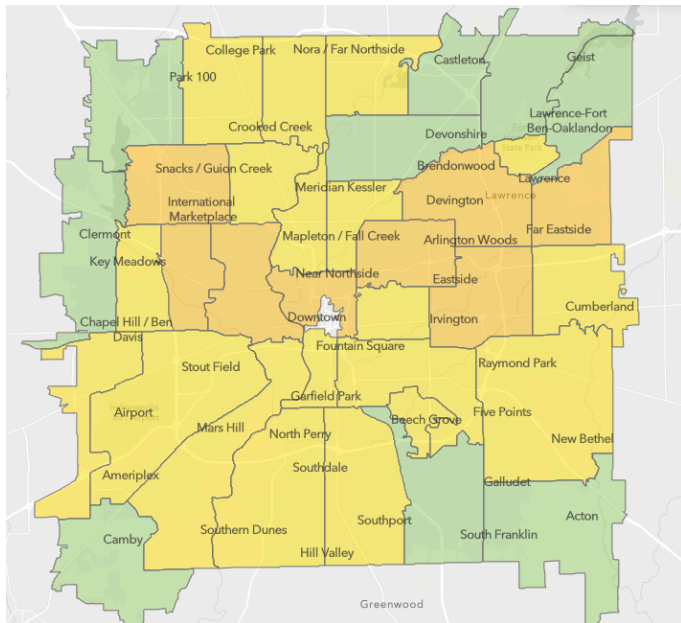

# High-Impact ZIP Codes

- 67 percent of residents are people of color.
- 27 percent of residents live under the poverty line
- One in five residents doesn't have a high school diploma
- 15 percent of residents have a disability

# Low-Impact ZIP Codes

- 22 percent of residents are people of color.
- 7 percent of residents live under the poverty line
- Only 6 percent residents don't have a high school diploma
- 10 percent of residents have a disability

# People of Color

Percent of residents who are people of color in ZIP codes where Covid-19 impact score is...

# Questions

# **Future impacts: a potential eviction crisis**

# Looming Eviction Crisis

- Between February and April of 2020, Indiana lost 436,000 jobs, driving the unemployment rate from 3.1% to 17.5%.
- Income support has ended for people who are unemployed.
- Eviction moratorium for Indiana expired on August 14.
- How will unemployment impact the eviction rate in neighborhoods?

# Formal vs. Informal Evictions

Our model only predicts formal evictions filed through the court system (the only data we have available).

According to Matthew Desmond and Tracey Shollenberger, most evictions are informal. Informal evictions can be 2X more frequent than formal evictions.

Desmond and Shollenberger, “Forced Displacement From Rental Housing: Prevalence and Neighborhood Consequences” (2015)

# Other National Estimates

[Stout Risius Ross](#) predict 42% of renters in Indiana at risk for eviction over next four months

[Urban Institute](#) estimates that 34% of renter households experienced job or income loss

- Although there is no direct relationship between job loss and formal evictions, and there is often at least a 6-month lag

# Other National Estimates

- [Urban Institute](#) has provided a national, census tract-level map estimating where emergency rental assistance programs may be most needed
  - This approach uses some of the same variables we used, but generated z-scores to create an index
  - We used regression modelling
  - Some variables they used were not statistically significant in our model

Emergency Rental Assistance Priority Index percentile

# Modeling evictions

- We developed a spatial regression model of evictions using demographic data, long-term socioeconomic conditions, and recent unemployment claims
- Our ‘spatial error’ model predicts that the Marion County eviction rates would increase 12 points, equivalent to 34,000 renters being formally evicted

# Modeling evictions

- Spatial error models do not assume direct spatial effects (e.g., census tracts do not have extra influence over their neighbors) but do account for general spatial clustering effects. Other models we tested were less effective

# Modeling evictions

Variables	Relative importance and direction
Housing cost burdened	3.4
Disability	3.1
Children per household	2.5
Unemployment claims	1.9
Older adults	-3.8
Income	-4.1
